Local Area Teachers Producing Web Sites For New School Year

Salyersville, KY (July 26, 2010) – Teachers from Pineville Independent, Middlesboro Independent, Bell, Harlan, Jackson Independent, Morgan, Boyd, Jackson, Floyd, Ashland Independent, Magoffin, Johnson, Lee, Knott Perry, and Owlsey County School Districts spent three days learning the latest computer programs. They were able to get hands-on experience creating individual web sites that contain video projects, photos, blogs and student work that will help make classrooms more exciting for students this fall.

It is all part of a unique program run by Kentucky-based Dataseam, which places new computers in schools for everyday classroom use and then networks those same computers together so scientists can use the processing power to do important discovery work. Researchers from the University of Louisville's James Graham Brown Cancer Center have already discovered several potential cancer drugs using the process.

Area schools have received thousands of computers as part of the program and teachers are making sure that they take advantage of all the dynamic capabilities of the machines. Teachers are able to create and share digital media that makes learning more interesting and relevant to today's students.

"People and companies use all types of new technology to communicate and get work done in our global economy," said Brian Gupton, Dataseam CEO. "These teachers are creating individual class web sites so they can share student work and communicate better with parents and the community. It is truly exciting to see this in action."

"My students are going to love creating new projects with the movie and other software we learned here this week," said Margie McCoy from South Magoffin Elementary School. "We can bring book reports to life on video and share them with parents and other students using easy to create web sites."

Over 400 teachers from across the state are taking part in these summer workshops. They join nearly 4,000 teachers, administrators and technicians who have participated in Dataseam sponsored courses that help educators better use technology in schools.
